Calculation of Tensile Force

The tensile force can be calculated approx. using the following formula::

$$F = \frac{\Phi \cdot G \cdot l \cdot g}{8000 \cdot h} \leq F_{perm.} \quad [kN]$$

In planning a flexible cable system it is necessary to calculate the carrying capacity of the rope. Normally plastic covered steel ropes are used which are suitable for most applications.

- F [kN] = Tensile force in the rope
- G [kg] = Total load of netweight of rope plus weight of cable trolleys and cables
- l [m] = Span width of rope
- h [m] = Sag of rope
- g [m/s²] = Gravitational acceleration = 9.81
- Φ = Net load factor = 1.1-1.2 to DIN 15018, section 4.1.4.1
Consideration is recommended.

Determination of Rope Load and Selection of Required Rope

The required rope can be determined with the help of the following diagrams.
The diagrams were issued with Φ = 1,2 and ϑ = 4.

Program 0210

Calculation Example

Given:

Total load G = 145 kg
Span width l = 100 m
Rope sag h_{perm.} = 2 m = 2%

Calculated values:

Diagram program 0210: not suitable
Diagram program 0215: suitable

From diagram program 0215
- existing rope load: F ≈ 10,5 kN
- required rope : 020303-10
